Đ. Tám Danh, Phường 4, Quận 8, Hồ Chí Minh, Việt Nam

EDUCATION

- Can Tho University – CTU
- Major: Computer Science
- Graduation: April 2025
- GPA: 2,83/4.0

SKILLS

- Computer Vision: OpenCV, YOLO
- Data Visualization: Matplotlib, Power BI
- Machine Learning Frameworks: Keras TensorFlow, PyTorch, Scikit-learn
- Programming: Python, Java, SQL
- Good communication skills

LANGUAGE

- English
- Japanese

About Me

I'm a recent Computer Science graduate with a solid academic foundation. I possess strong attention to detail, logical thinking, and effective teamwork skills. My strengths include patience, thoroughness in analysis, as well as a strong eagerness to learn and the ability to quickly adapt to new technologies and processes. In the future, I aspire to become a professional software engineer who not only develops efficient products but also delivers meaningful value to users. I aim to specialize in programming and data technologies while contributing to projects that create a positive impact on society.

Work Experience

INTERACTIVE IMAGE GENERATION WITH GANS (GRADUATION THESIS)

Duration: September - November 2024

Project Description:

- The project focused on applying deep learning techniques for image synthesis using Generative Adversarial Networks (GANs). It aimed to develop an interactive system capable of generating realistic images from user inputs, such as sketches or parameters. The system demonstrated the practical integration of machine learning models with user interfaces, emphasizing the potential of GANs in creative and computer vision applications.

Team size: 1

Responsibilities:

- Researched and implemented Generative Adversarial Networks (GANs) for realistic image generation.
- Developed an interactive desktop application using Tkinter to allow users to customize input parameters.
- Utilized ISAT for image annotation and dataset preparation.
- Designed and trained deep learning models with TensorFlow/Keras, integrating image preprocessing via OpenCV and NumPy.
- Evaluated model performance using image quality metrics and visual analysis.

Technologies used:

Python, TensorFlow, Keras, OpenCV, NumPy, Matplotlib, Tkinter, ISAT, Kaggle, Google Colab

PET SHOP WEBSITE

Duration: April – May 2023

Project Description:

- The project was designed to manage pet sales, inventory, and customer orders. It helps streamline the sales process, track products, and improve customer experience through an online platform.

Team size: 1

Responsibilities:

- Designed and developed the web application using the MEVN stack (MongoDB, Express.js, Vue.js, Node.js).
- Built RESTful APIs to handle product management, order processing, and user authentication.
- Designed database schema and managed data with MongoDB Compass.
- Implemented responsive user interface using Vue.js for seamless interaction.

Technologies used:

MongoDB, Express.js, Vue.js, Node.js, MongoDB Compass

SYSTEM MANAGEMENT LIBRARY

Duration: April – May 2022

Project Description:

- That project was developed as a desktop application to support librarians in managing books, members, and borrowing transactions. Its purpose was to reduce manual work, minimize errors, and improve overall efficiency in daily operations.

Team size: 1

Responsibilities:

- Designed and implemented core features for book and member management.
- Developed the user interface using Java Swing for an intuitive and responsive experience.
- Connected the application to a MySQL database using JDBC for data storage and retrieval.
- Designed and managed database schema through MySQL Workbench.
- Tested system functionalities and optimized query performance.

Technologies used:

Java, Java Swing, JDBC, MySQL, MySQL Workbench
